

Project Design Phase
Proposed Solution Template

Date	30 September 2026
Team ID	SWITD-2026-4934
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	2 Marks

Proposed Solution Template:

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Incidents need consistent, accurate data for triage, routing and resolution, but manual checks lead to incomplete or incorrect entries. This hurts reporting accuracy, SLA compliance and service quality, so field behavior and validation must be enforced at the user interface level.
2.	Idea / Solution description	UI Policy “High Impact Control” (Impact = 1 - High) makes Assignment group mandatory and Urgency read-only, reversing when false. An onChange script auto-sets Urgency to High, an onSubmit script blocks save if Assigned To is empty, and an onCellEdit script blocks State edits from the list.
3.	Novelty / Uniqueness	Combines a UI Policy with three client script types (onChange, onSubmit, onCellEdit) into one layered client-side control with instant feedback and no server-side code.
4.	Social Impact / Customer Satisfaction	Valid Incident data means faster triage, correct routing and fewer SLA breaches, so users get quicker resolutions, agents do less rework and reports are more reliable.
5.	Business Model (Revenue Model)	Value is internal: lower rework cost, fewer SLA misses and better data quality. It can be packaged as an update set and offered as an implementation service by ServiceNow partners.
6.	Scalability of the Solution	The pattern extends to other tables (Problem, Change, Task) and rules, moves between instances via update sets, and runs on the client so server load stays low.
