

Customer Journey Map

Project: Implement Client Script & UI Policy (Incident) | **Team ID:** SWTID-2026-4934

Scenario: Configuring, using and testing client-side validation (UI Policy and Client Scripts) on the ServiceNow Incident form. **Personas:** ServiceNow Administrator; Service Desk Agent / Incident Manager.

SCENARIO Configure, use and test Incident validation	 Entice How does someone initially become aware of this process?	 Enter What do people experience as they begin the process?	 Engage In the core moments in the process, what happens?	 Exit What do people typically experience as the process finishes?	 Extend What happens after the experience is over?
 Steps What does the person (or group) typically experience?	1. Notice incomplete or inconsistent Incident data 2. Decide the rules needed for High impact incidents	1. Log in to the ServiceNow instance 2. Open System UI > UI Policies and create "High Impact Control"	1. Add UI Policy Actions (Assignment group mandatory, Urgency read-only) 2. Create onChange, onSubmit and onCellEdit Client Scripts	1. Agent sets Impact = High and submits the form 2. Save is allowed or blocked by validation	1. Test reverse condition, list-edit blocking and form update 2. Rules stay active for every Incident
 Interactions What interactions do they have at each step? People, Places, Things	People: Administrator, service desk lead Places: Incident list and reports Things: Business rules, SLA data	People: Administrator Places: ServiceNow instance in browser Things: System UI > UI Policies	People: Administrator Places: UI Policy form, Client Script editor Things: JavaScript, g_form API	People: Service Desk Agent, Incident Manager Places: Incident form Things: Impact, Urgency, Assigned To	People: Incident Manager Places: Incident form and list view Things: State field, double-click edit
 Goals & motivations At each step, what is the primary goal or motivation?	Help me understand why incident data is inconsistent	Help me reach the right configuration screens quickly	Help me enforce rules on the form without server-side code	Help me submit only complete and valid incidents	Help me confirm every rule works and reverts correctly
 Positive moments What steps does a typical person find enjoyable, productive or delightful?	Clear rules make triage and routing easier	Simple navigation, no external tools needed	Urgency is auto-set to High; rules react instantly in the browser	A clear error on Assigned To guides the fix; valid records save smoothly	"Reverse if false" restores fields; cleaner data for reporting
 Negative moments What steps does a typical person find frustrating or confusing?	Incomplete data hurts reporting and SLA compliance	Risk of choosing the wrong table or condition	A typo in a field name can break the script	Save is blocked until Assigned To is filled in	State cannot be edited from the list; the form must be opened
 Areas of opportunity How might we make each step better?	Standardise data-entry rules for more fields	Document policy names and conditions clearly	Reuse scripts; add server-side checks for imports and APIs	Show helpful field messages to guide agents	Add more test cases; extend to Problem and Change
